

Local Docker vs. Railway (beta, actual) vs. Forge (ADR-0001, never built)

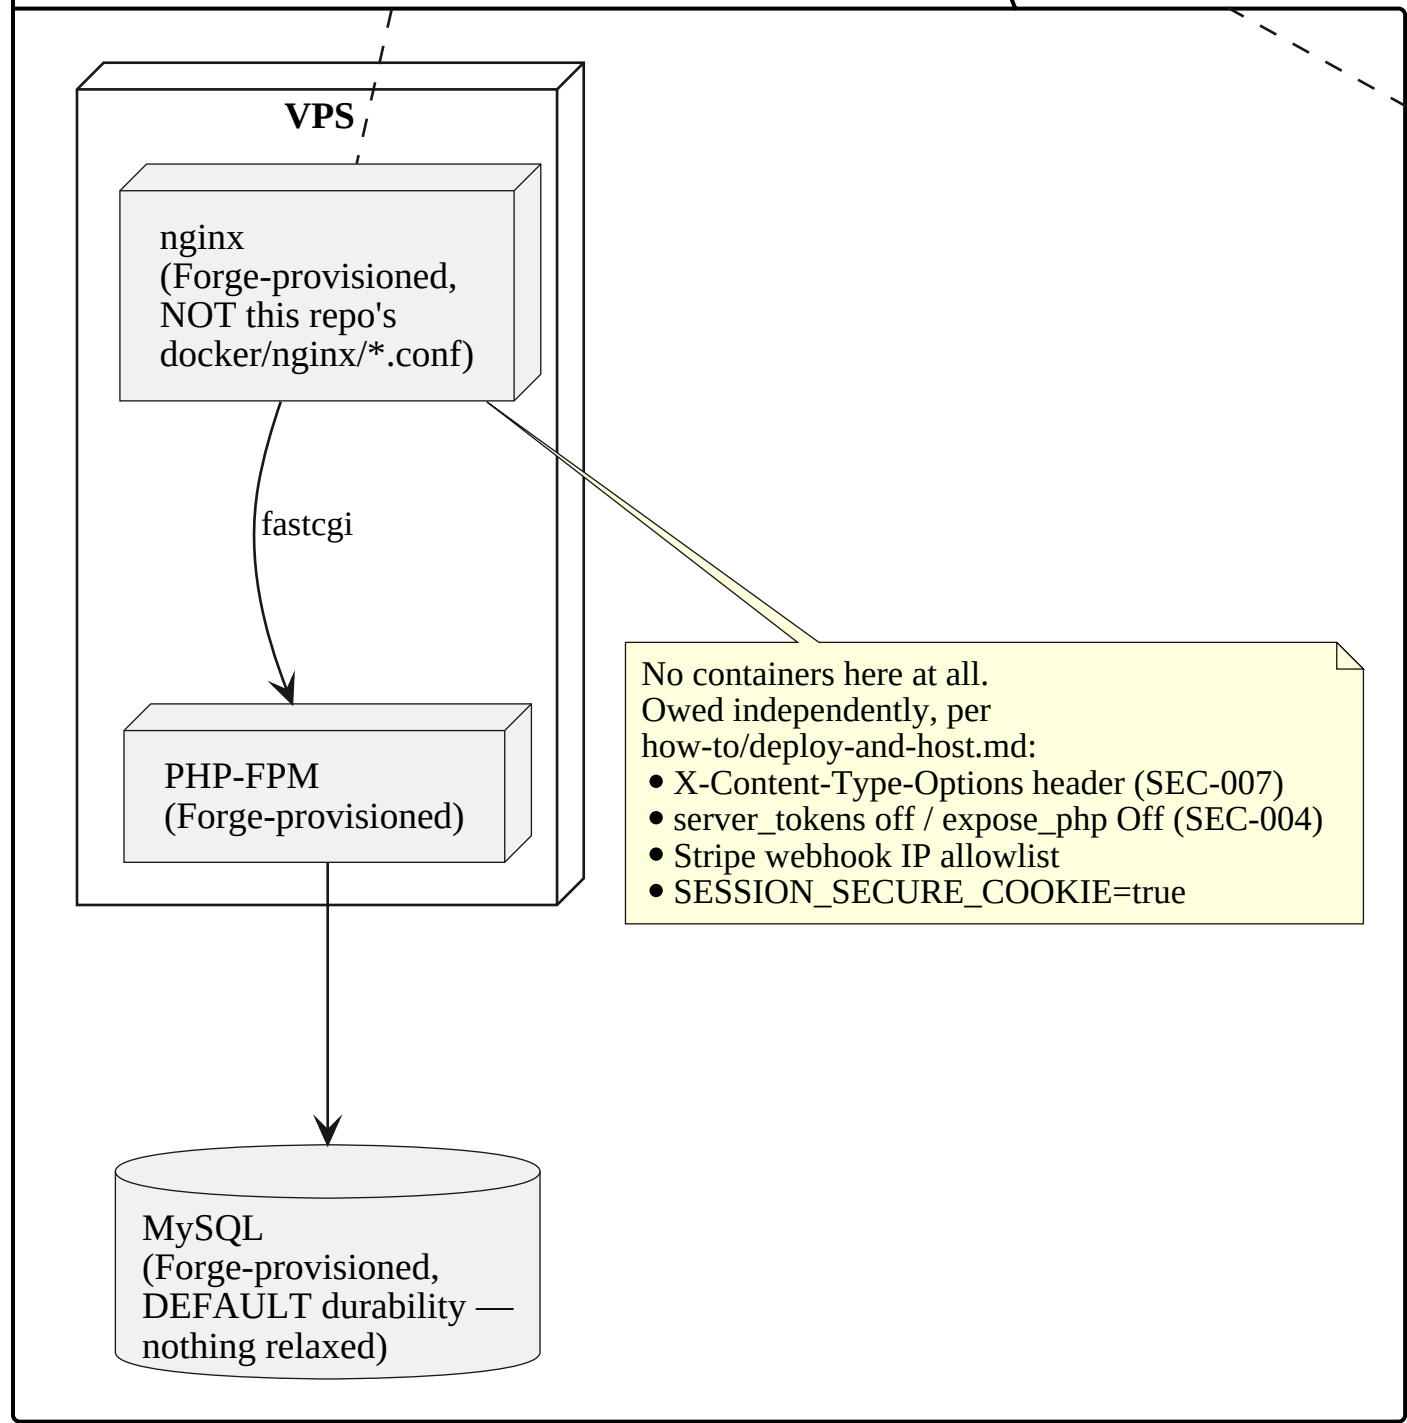

Beta — Railway (ADR-0023), what actually runs

The gap between these boxes is why `deploy-and-host.md` exists. Anything fixed only in this repo's `docker/nginx/*.conf`, or only in the local `.env`, is invisible to both deployed topologies — it has to be set again, deliberately, per host.

Railway is the only one of the three that has actually run. Forge remains a checklist, not a box.

Production — Laravel Forge (ADR-0001, never provisioned)

Local development — docker-compose.yml
